

How to save beer using an Empty Keg Simulator (eks)

1) After deciding which product you want to save before cleaning the line, remove the relevant coupler from the keg

2) Fit the appropriate Empty Keg Simulator onto the coupler, and leave gas on

3) If a Fob detector is fitted to the line, put it into 'clean mode' by pushing the knob upwards and then hold it in place with the Red over ride switch

4) Everything is now connected as it should be. Go to the bar and dispense beer as normal until line/s empty. The beer in the line/s can now be safely 'sold off' as the beer is being pushed through the lines by gas, so no danger of beer/water mix.

Remember to sell off beer from ALL taps connected to the selected keg
